gluons  $\Rightarrow$  “final state interactions”  $\rightarrow$  additional momentum exchange.  
“Time-reversal odd TMDs” would not exist without this mechanism.

# definition of TMDs

light cone coordinates

$$w^\pm = \frac{1}{\sqrt{2}}(w^0 \pm w^3), \\ \text{so } w = w^+ \hat{n}_+ + w^- \hat{n}_- + w_T$$

proton flies along z-axis:

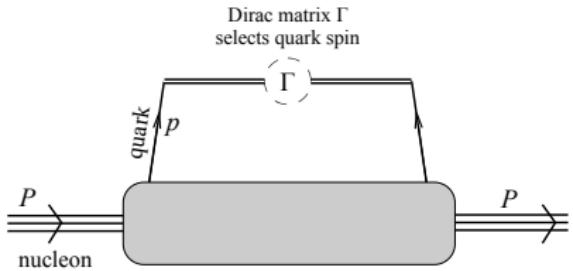

$P^+$  large,  $P_T = 0$

$$\Phi^{[\Gamma]} \equiv “ \langle P, S | \bar{q}(p) \Gamma q(p) | P, S \rangle ”$$

parametrization in terms of TMDs, example

$$\int dp^- \Phi^{[\gamma^+]} \Big|_{p^+ = x P^+} = f_1(x, \mathbf{p}_T^2; \hat{\zeta}, \dots) - \frac{\epsilon_{ij} \mathbf{p}_i \mathbf{S}_j}{m_N} f_{1T}^\perp(x, \mathbf{p}_T^2; \hat{\zeta}, \dots)$$

mechanism [PRD (2005)] with  $\kappa_T$  from lattice [GÖCKELE et. al. PRL (2007)]

Lattice studies for TMDs as in SIDIS or Drell-Yan are possible

- for ratios of Fourier-transformed TMDs
- using space-like Wilson lines  
as in [AYBAT, ROGERS arXiv:1101.5057 (2011)]  
and J. Collins' book (to be published)

proof-of-concept results at  $m_\pi \approx 500$  MeV,  $|\mathbf{b}_T| = 0.36$  fm:

- Sivers:  $m_N \int dx \tilde{f}_{1T}^{\perp(1)}(x, \mathbf{b}_T^2) / \int dx \tilde{f}_1^{(0)}(x, \mathbf{b}_T^2)$  :  
signs different for up and down quarks
- Boer-Mulders:  $m_N \int dx \tilde{h}_1^{\perp(1)}(x, \mathbf{b}_T^2) / \int dx \tilde{f}_1^{(0)}(x, \mathbf{b}_T^2)$  :  
same sign for up and down quarks

Major challenge:

- Currently relatively low Collins-Soper evolution parameter  $\hat{\zeta}$ .
